APRESENTAÇÃO

A fitossanidade em geral e particularmente o controle de doenças nos seringais de cultivo, é responsável por uma apreciável proporção dos custos com a manutenção desta cultura, especialmente nas regiões onde as condições edafoclimáticas favorecem o surgimento e proliferação das doenças da seringueira.

Presentemente, o Centro Nacional de Pesquisa de Seringueira e Dendê da EMBRAPA, está desenvolvendo, com o apoio financeiro da SUDHEVEA, nada menos que 25 projetos de pesquisa envolvendo 77 ensaios na área de fitopatologia da seringueira, que deverão absorver em 1984, cerca de 33% do orçamento de pesquisa desta cultura.

Estes dados por si sô comprovam o esforço que vem sendo desenvolvido no sentido de se obter um aumento do conhecimento científico que possibilite maior eficiência na sanidade dos seringais. Esta publicação, se de um lado cataloga o conjunto destes conhecimentos até agora obtidos, possibilita, de outro lado, a facilidade necessária a novas investigações por parte dos pesquisadores interessados, além de fornecer, para outros públicos, produtores em especial, determinadas informações relevantes aos respectivos interesses.

Espera-se que brevemente esta publicação possa ser enriquecida com o acréscimo de novos trabalhos pertinentes à especialização, como também, pelas críticas recebidas dos leitores a respeito de possíveis imperfeições e falhas que contenha.

Tomás A. Guimarães

Chefe Adjunto de Apoio do CNPSD

INTRODUÇÃO

O cultivo da seringueira no Brasil, particularmente na região amazônica e no sul da Bahia, sempre teve nas enfermidades, principalmente nas doenças de folhas, o seu principal fator de estrangulamento.

A elevada umidade nessas regiões favorece o desenvolvimento de diversos agentes patogênicos, entre os quais o *Microcyclus ulei*, o *Phytophthora* spp. e o *Thanatephorus cucumeris*, fungos causadores do "mal-das-folhas", da "requeima" e da "mancha areolada", respectivamente, consideradas as principais doenças da seringueira no Brasil.

Os prejuízos causados por estas e outras moléstias requerem conhecimentos pormenorizados de sua epidemiologia, sintomas e controle, como condição indispensável para tornar a heveicultura um empreendimento lucrativo.

Isto supõe, naturalmente, uma ação ordenada e constante de pesquisa, no sentido de aprofundar esses conhecimentos, de modo a minimizar os efeitos das enfermidades, os custos do seu controle, e o fornecimento de ferramenta ou informação apropriadas aos produtores e a assistência técnica para aumentar as possibilidades de sucesso dos seringaais.

Esta bibliografia objetiva atender a esses diferentes usuários, ao mesmo tempo que dá uma idéia da evolução da pesquisa e do conhecimento nessa área. A obra, dividida em quatro partes abrange: aspectos gerais das doenças, doenças de folhas, doenças de raízes e doenças do caule, reunindo 911 referências, compiladas até 1982.

O arranjo adotado foi ordem alfabético, por autor, dentro dos diversos assuntos.

Os autores registram seus agradecimentos aos funcionários do SID-CNPSD, em especial a Bibliotecária Palmira Costa Novo Sena; pela valiosa colaboração, por ocasião da elaboração deste trabalho.
